

**A METHOD FOR DEVELOPING A CUSTOM TAGBEAN****ABSTRACT OF THE DISCLOSURE**

5

A method for simplifying the development, testing and maintenance of code objects that may be used, for example, to generate custom web page content.

According to the invention, a developer isolates a given task, generates code for the task, and then provides a means by which a page-generating Java servlet can access  
10 that code at request time. The code may be generated at any time, and the servlet preferably is generated at translation time, i.e. when a request for the page is first made at a server. In a preferred embodiment, the code for the task is supported within a given method of a Java tagbean.
